

Description: For the use of this sound, I found that still learning about wires and gates still has a lot of work to do in order to become more comfortable with VCV rack. As for this sound that I had created, I had used 2 LFOs to manipulate the original additive synthesis sound. While the use of the triangle wave LFO on the second channel. At the same time using the WT LFO and changing the wave shape. While from there the trick was equalizing out both of the sounds to sound more pleasant.

As for when it comes to describing how this sound really sounds like, I would say an electric flute would best describe this. There is an artist named Flume who does more experimental sounds and combinations to create his songs, as this gave me a "flume" feeling.
